1. Introduction

1.1 Background

The Department of Defense (DoD) Air Force Continuous Acquisition and Life-cycle Support (CALS) Test Network (AFCTN) is conducting tests of the military standard for the Automated Interchange of Technical Information, MIL-STD-1840A, and its companion suite of military specifications. The AFCTN is a DoD sponsored confederation of voluntary participants from industry and government managed by the Electronic Systems Center (ESC).

The primary objective of the AFCTN is to evaluate the effectiveness of the CALS standards for technical data interchange and to demonstrate the technical capabilities and operational suitability of those standards. Two general categories of tests are performed to evaluate the standards; formal and informal.

Formal tests are large and comprehensive, which follow a written test plan, require specific authorization from the DoD, and may take months to prepare, execute, and report.

Informal tests are quick and short, used by the AFCTN technical staff, to broaden the testing base. They include representative samples of the many systems and applications used by AFCTN participants. They also allow the AFCTN staff to gain feedback from many industry and government interpretations of the standards, to increase the base of participation in the CALS initiative, and respond to the many requests for help that come from participants. Participants take part voluntarily, benefit by receiving an evaluation of their latest implementation (interpretation) of the standards, interact with the AFCTN technical staff, gain experience using the standards, and develop increased confidence in them. The results of informal tests are reported in Quick Short Test Reports (QSTRs) that briefly summarize the standard(s) tested, the hardware and software used, the nature of the tests, and the results.

1.2 Purpose

The purpose of the informal test, reported in this QSTR, was to analyze IBM SID Boulder's interpretation and use of the CALS standards in transferring technical publication data. IBM SID used its CALS Technical Data Interchange System to produce data, in accordance with the standards, and delivered it to the AFCTN technical staff on a 9-track magnetic tape.

2. Test Parameters

Test Plan: AFCTB 93-069

Date of
Evaluation: 09 July 1993

3. 1840A Analysis

3.1 External Packaging

The tape arrived at the Air Force CALS Test Bed (AFCTB) enclosed in a box in accordance with ASTM D 3951. The exterior of the box was marked with a magnetic tape warning label, as required by MIL-STD-1840A, para. 5.3.1.3.

The tape was enclosed in a barrier material as required by MIL-STD-1840A, para. 5.3.1.2. Inspection of the tape reel showed a label indicating the recording density, as required by MIL-STD-1840A, para. 5.3.1. Enclosed in the box was a packing list showing all files recorded on the tape.

3.2 Transmission Envelope

The 9-track tape received by the AFCTB contained MIL-STD-1840A files. The files were named per the standard conventions.

3.2.1 Tape Formats

The tape was run through the AFCTN *Tapetool* v1.2.9 utility. No errors were encountered while evaluating the contents of the tape labels.

The tape was read using the XSoft *CAPS read1840A* utility without any reported errors.

The tape was read using the AFCTN *Tapetool* v1.2.10 beta utility without a reported error.

The physical structure of the tape meets the MIL-STD-1840A requirements.

3.2.2 Declaration and Header Fields

No errors were found in the Document Declaration file and data file headers. This portion of the tape meets the CALS MIL-STD-1840A requirements.

4. IGES Analysis

No Initial Graphics Exchange Specification (IGES) files were included on this tape.

5. SGML Analysis

The tape contained three (3) DTD and Text files. The AFCTB has several parsers available for evaluating submitted DTD and Text files. These tools are not used to generate a pass/fail but to report how commercially available software can handle the files. These products are used in the development of technical publications and are good indicators of usability. The use of these products is not an endorsement nor an indication of CALS capability. All operations were performed using the default settings unless specified in the report. Changes to DTD or Text files required by each system are not documented in the report.

The Text and DTD files from the tape were evaluated using Datalogics' *ParseStation*, with no reported errors.

The Text and DTD files were evaluated using Exoterica's *Validator exl* parser, with no reported errors.

The Text and DTD files were tested using Exoterica's *XGML-Normalizer*, with no reported errors.

The Text and DTD files were evaluated using McAfee & McAdam's *Sema Mark-it* parser, with no reported errors.

The Text and DTD files were evaluated using the Public Domain *sgmls* parser, with no reported errors.

The SGML files meet the CALS MIL-M-28001A specification.

6. Raster Analysis

The tape contained 18 Raster files. All files were evaluated using the AFCTN *validg4* utility. This program reported that all 18 files meet the CALS MIL-R-28002A specifications.

The files were read into the AFCTN *calstb.475* viewing utility. No problems were noted.

The AFCTB has several tools for viewing Raster files. These tools are not used to generate a pass/fail but to report how commercially available software can handle the files. Many of these products are used in the development of technical publications and are good indicators of usability. The use of these products is not an endorsement nor an indication of CALS capability. All operations were performed using the default settings.

The files were converted using ArborText's *g42tiff* utility without a reported error. The resulting files were read into Island Graphics' *IslandPaint*, displayed and printed.

The Raster files were read into Carberry's *CADLeaf* software without a reported error. They displayed without a problem, and a sample was printed.

The files were read into IDA's *IGESView* and *IGESView for Windows* without a reported error. They displayed without a problem, and a sample was printed.

The files were read into Inset Systems' *HiJaak for Windows* without a reported error and were displayed.

Even though the files were successfully imported, displayed, and in some cases printed, errors were noted in the actual information. The errors were probably generated during the conversion from CGM to Raster images. According to Ina Dickinson of IBM SID, Boulder, "The Rasters were generated from converting CGMs from a non-IBM graphics program." On files R008, R009, R010, R011, R012, R013, and R019 the text displayed in different size letters. File R011 also had missing vertical lines. See the Appendix for samples of these files.

The Raster files meet the CALS MIL-R-28002A specification, but have data acceptance problems.

7. CGM Analysis

The tape contained eight CGM files. The files were evaluated using ATC's *MetaCheck* with CALS options. All eight files were reported as meeting the CALS MIL-D-28003 specification. All files except C004, C009 and C011 had warning notes issued.

The AFCTB has several tools for viewing CGM files. These tools are not used to generate a pass/fail but to report how commercially available software can handle the files. Many of these products are used in the development of technical publications and are good indicators of usability. The use of these products is not an endorsement nor an indication of CALS capability. All operations were performed using the default settings.

The CGM files were converted using ArborText's *cgm2draw* utility without a reported error. The resulting files were read into Island Graphics' *IslandDraw*, displayed and printed.

The files were viewed using ATC's *MetaView* software. The background color of some images made them unusable.

The files were read into Carberry's *CADLeaf* software and displayed without a reported error. Files C004, C008, C009, and C010 required the background color to be changed in order to see the image.

The files were read into Inset Systems' *HiJaak for Windows* without a reported error. File C011 required a background color change to view the image.

The files could not be imported directly into Island Graphics' *IslandDraw* because of hard drive memory limitation.

The files were imported into the Micrografx *Designer* without a reported error. File C006 required the background color to be changed in order to display the image, and files C005 and C010 did not display.

According to Michael Harrison of Micrografx, "The version of Micrografx *Designer* used with this report has been replaced with *Designer* version 4.0 which reads and prints these files successfully."

The files were imported into SPC's *Harvard Graphics v3.05* without a reported error. A background color change was required, due to black on black combinations, for those files defined in the CADleaf evaluation.

The files were imported into Corel's *Ventura Publisher* without a reported error. Background color problems made some of the images unusable. They displayed and printed as a blank sheet of paper.

Although the included CGM files meet the CALS MIL-D-28003 specification, problems with the background colors required many of the files to be modified in order to view and print.

8. Conclusions and Recommendations

The physical structure, CALS headers, and Document Declaration file of the tape from IBM SID Boulder meet the CALS MIL-STD-1840A requirements.

The SGML files on this tape meet the CALS MIL-M-28001A specification.

The Raster files on this tape meet the CALS MIL-R-28002A specification.

The CGM files on this tape meet the CALS MIL-D-28003 specification. However, many of the included files had conflicts in the background color. This required modifications to the files, in most software applications, in order to provide a usable image.

The tape submitted by IBM SID Boulder meets the CALS MIL-STD-1840A requirements.
